

# Wind power generation operation and maintenance management system

How can O&M services help offshore wind power generation facilities?

Through handling large-scale plants, we have refined our remote monitoring technology to monitor equipment status and detect prediction using various sensors. Utilizing these technologies, human resources, and experience, we will develop comprehensive O&M services for offshore wind power generation facilities.

What is O&M for offshore wind power generation?

O&M (operation and maintenance) for offshore wind power generation is much more difficult than that for onshore facilities, and the impact of equipment failures will be greater and more critical. We have provided EPC and O&M services for various power generation facilities, including onshore wind power generation facilities.

How effective is O&M management for offshore wind farms?

Effective operation and maintenance (O&M) management is significant for enhancing the economic performance of offshore wind farms. Despite recent research progress in O&M, there remains a gap in integrating health prognostics and spare parts inventory into decision-making processes at the scale of offshore wind farms.

Who is responsible for O&M for offshore wind farms?

Moreover, in practical O&M for offshore wind farms, it is common for the original equipment manufacturer (OEM) or maintenance service provider to assume dual roles as decision-makers responsible for both maintenance planning and spare parts provision.

What is the O&M scheduling strategy of offshore wind farms?

The O&M scheduling strategy of offshore wind farms refers to arranging appropriate maintenance tasks and power generation tasks according to the operating status, maintenance requirements, resource conditions, and other factors of wind farms, to improve the economy and reliability of wind farms.

What percentage of wind energy is attributed to O&M?

Up to 30% of the total cost of wind energy is attributed to operation and maintenance (O&M), and maintenance activities and spare parts account for the largest portion (43%) of O&M for wind turbines.
